Partial Bayes Factors v1.1 20240612

$$\frac{p(\mathcal{M}_{j} \mid \mathbf{y})}{p(\mathcal{M}_{i} \mid \mathbf{y})} = \frac{p(\mathbf{y} \mid \mathcal{M}_{j})}{p(\mathbf{y} \mid \mathcal{M}_{i})} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta \in \Theta_{j}} p(\mathbf{y} \mid \theta, \mathcal{M}_{j}) \cdot \pi(\theta \mid \mathcal{M}_{j}) d\theta}{\int_{\theta \in \Theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta_{i}) \cdot \pi_{j}(\theta_{j}) d\theta_{j}}{\int_{\theta \in \Theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta_{i}) \cdot \pi_{j}(\theta_{j}) d\theta_{j}}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta_{i}) \cdot \pi_{i}(\theta_{i}) d\theta_{i}} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta_{i}) \cdot \pi_{j}(\theta_{i}) d\theta_{j}}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{j})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{i})}{p(\mathcal{M}_{i})} = \frac{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) \cdot \pi(\theta \mid \mathcal{M}_{i}) d\theta}{\int_{\theta_{i}} p(\mathbf{y} \mid \theta, \mathcal{M}_{i}) d\theta} \cdot \frac{p(\mathcal{M}_{i})}{p(\mathcal{M}_{i})} d\theta} \cdot \frac{p(\mathcal{M}_{i})}{p(\mathcal{M}_{i})}$$

Problem

Given a prior $\pi_i(\theta_i) = c_i \cdot \tilde{\pi}_i(\theta_i)$, if the normalizing constant c_i does not exist, then $\tilde{\pi}_i(\theta_i)$ is improper. Provided that the integral in Eq. 1 converges, c_i cancels out in the posterior $\pi_i\left(\boldsymbol{\theta}_i\mid\boldsymbol{y}\right)=p_i\left(\boldsymbol{y}\mid\boldsymbol{\theta}_i\right)\cdot\tilde{\pi}_i\left(\boldsymbol{\theta}_i\right)\left/\tilde{m}_i\left(\boldsymbol{y}\right)\right.$ (an improper prior leads to a proper posterior), but does not cancel out in the Bayes factor $B_{ii} = (c_i/c_i) \cdot \tilde{B}_{ji}$ B_{ii} is undetermined since c_i/c_i is arbitrary.

Motivation 1

A model selection method that is automatic and produces actual Bayes factors with respect to proper priors.

Method 1

The intrinsic Bayes factor (IBF)

- Used a *training sample* y_l to convert the noninformative priors $\tilde{\pi}_i(\theta_i)$ to proper posteriors $\pi_i(\theta_i \mid y_l)$, assuming y_l is *proper* if its marginal likelihoods $\tilde{m}_i(y_l) \in (0, +\infty), \forall i$, and minimal if it is proper and no subset is proper;
- Computed the IBF $B_{ii}(\mathbf{y}_l^{\complement} \mid \mathbf{y}_l)$ based on the remaining data partition $\mathbf{y}_l^{\complement}$ and the "priors" $\pi_i(\boldsymbol{\theta}_i \mid \mathbf{y}_l)$;

$$m_i \left(\mathbf{y}_l^{\complement} \mid \mathbf{y}_l \right) = \int p_i \left(\mathbf{y}_l^{\complement} \mid \boldsymbol{\theta}_i, \mathbf{y}_l \right) \cdot \pi_i \left(\boldsymbol{\theta}_i \mid \mathbf{y}_l \right) d\boldsymbol{\theta}_i \quad \Longleftrightarrow \quad m_i (\mathbf{y}) \mid m_i (\mathbf{y}_l)$$
 (2)

$$B_{ji}(\mathbf{y}_l^{\mathbb{C}} \mid \mathbf{y}_l) := m_j(\mathbf{y}_l^{\mathbb{C}} \mid \mathbf{y}_l) / m_i(\mathbf{y}_l^{\mathbb{C}} \mid \mathbf{y}_l) = \tilde{B}_{ji} \cdot \tilde{B}_{ij}(\mathbf{y}_l)$$
(3)

Selected another minimal training sample, iterated *l*, and averaged the IBFs (arithmetic or geometric).

$$AIBF_{ji} := \frac{1}{L} \sum_{l=1}^{L} B_{ji} \left(\mathbf{y}_{l}^{\mathbb{C}} \mid \mathbf{y}_{l} \right) = \tilde{B}_{ji} \cdot \frac{1}{L} \sum_{l=1}^{L} \tilde{B}_{ij} (\mathbf{y}_{l})$$

$$GIBF_{ji} := \left(\prod_{l=1}^{L} B_{ji} \left(\mathbf{y}_{l}^{\mathbb{C}} \mid \mathbf{y}_{l} \right) \right)^{1/L} = \tilde{B}_{ji} \cdot \left(\prod_{l=1}^{L} \tilde{B}_{ij} (\mathbf{y}_{l}) \right)^{1/L}$$

* Caution the " notation and the subscripts ii or ii

Motivation 2

An alternative to the IBFs that avoids the selection of and the subsequent averaging over training samples.

n and m are the sample and minimal training sample sizes, respectively.

Method 2

The fractional Bayes factor (FBF)

- Cancelled out c_i and kept $\tilde{\pi}_i(\theta_i)$, but used a fraction $b = m/n \in (0,1)$ of the likelihood to properize Eq. 4.
- Show that the likelihood $p_i(y_l | \theta_i) \rightarrow p_i(y | \theta_i)^b$ as $m, n \rightarrow +\infty$.

$$m_{i}(\boldsymbol{b}, \mathbf{y}) = \frac{\int p_{i}(\mathbf{y} \mid \boldsymbol{\theta}_{i}) \cdot \tilde{\pi}_{i}(\boldsymbol{\theta}_{i}) \, \mathrm{d}\boldsymbol{\theta}_{i}}{\int p_{i}(\mathbf{y} \mid \boldsymbol{\theta}_{i})^{\boldsymbol{b}} \cdot \tilde{\pi}_{i}(\boldsymbol{\theta}_{i}) \, \mathrm{d}\boldsymbol{\theta}_{i}} \quad \to \quad \tilde{m}_{i}(\mathbf{y}) / \tilde{m}_{i}(\mathbf{y}_{l})$$

$$(4)$$

$$FBF_{ji} := m_j(b, y) / m_i(b, y) = \tilde{B}_{ji} \cdot \tilde{B}_{ij}(b)$$
(5)

A simple linear regression without an intercept, $y_i = \beta x_i + \epsilon_i, \quad \epsilon_i \overset{\text{i.i.d.}}{\sim} \quad \mathcal{N}(0, \ \sigma_\epsilon^2) \text{ for } i = 1, \cdots, n.$ Example:

Assume a Jeffreys prior $\tilde{\pi}_1(\beta, \, \sigma_{\epsilon}) = 1 \, / \, \sigma_{\epsilon}$.

 $\mathcal{H}_0: \beta = 0 \text{ versus } \mathcal{H}_1: \beta \neq 0. \qquad \text{Assume a Jeffreys prior } \tilde{\pi}$ $FBF_{01} = \frac{\Gamma(n/2) \cdot \Gamma((n\frac{b}{2}-1)/2)}{\Gamma((n-1)/2) \cdot \Gamma(n\frac{b}{2}/2)} \cdot \left(1 + (n-1)^{-1}F\right)^{-n(1-b)/2}, \text{ where } F = \frac{\text{MSR}}{\text{MSE}} = \frac{\text{SSR } / 1}{\text{SSE } / (n-1)}.$ **Questions**: What is *m*?

DISCUSSIONS

1. The Valencia International Meetings on Bayesian Statistics (every four years from 1979 to 2010).

"... a growing emphasis on computational issues, concerned with making Bayesian methods routinely available to applied practitioners ..."

Debate over *subjective* or *objective* Bayesian methods.

The objective Bayesian methods are typically based on noninformative priors and are sometimes called "default" or "automatic" (including but not limited to "intrinsic") Bayesian methods, i.e., not requiring substantial prior input from the user, to avoid the loaded connotation of the label "objective".

"I (Berger) am more of an objective Bayesian than a subjective Bayesian. We were conducting objective Bayesian analyses in very large model spaces, such as variable selection with 100 variables. In Bayesian analysis, you have to assign prior probabilities to models, and you cannot do subjective assignment of 2100 models."

Hierarchical model specification.

Improper priors combined with proper hyperpriors can result in proper marginal priors.

$$\text{3. Derive } \int_0^\infty \int_{-\infty}^\infty \prod_{i=1}^n \left(\mathcal{N}(y_i \mid \mu, \, \sigma^2) \right)^b \cdot \frac{1}{\sigma} \, \mathrm{d}\mu \, \, \mathrm{d}\sigma \, .$$

Recall the Pearson Bayes factor for one-way analysis of variance in between-subjects designs.

$$PBF_{10} = \frac{\Gamma\left(\frac{df_{\rm B}}{2} + 1 + \gamma\right) \cdot \Gamma\left(\frac{df_{\rm W}}{2}\right)}{\Gamma\left(\frac{df_{\rm T}}{2}\right) \cdot \Gamma(1 + \gamma)} \left(\frac{df_{\rm W}}{df_{\rm W} + df_{\rm B}F}\right)^{-\frac{df_{\rm W}}{2} + 1 + \gamma},$$

where $df_{\rm B}=a-1$, $df_{\rm W}=N-a$, and $df_{\rm T}=N-1$ are the degrees of freedom for between-groups, within-group, and total sources of variation, respectively. $N = \sum_{i=1}^{a} n_i$

Coherence conditions are (i) $B_{12} = B_{10} \cdot B_{02}$ and (ii) $B_{01} = 1 / B_{10}$ when the priors are proper. TBC p. 270 Show that the FBF satisfies (ii) but not (i). Show that neither the AIBF nor the GIBF satisfy (i) and (ii).
